A location is not the content address

ORDERED IDENTITY

[t, a, r] ≠ [r, a, t]
Hash ordered child IDs
Retain order and repeats

CENTROID GEOMETRY

Same immediate multiset
→ same integer sum / count
→ same centroid

RECONSTRUCTION

Read the stored child path
Expand runs / descendants
Recover the original sequence

Same position can hold different ordered content.

Geometry supplies a location. The ordered content address and stored path carry identity and order. Prototype code checks a hash hit against the children, but a mismatch increments a counter and returns the existing record; that path is not collision repair.
